

Modular Joinery

An update to the popular Modular Joinery object from Graphisoft UK delivering key customer defined improvements. The object provides a flexible configurator for doors, windows, panels and louvers within one object. Object configurations once defined can be saved for later use. The initial profiles were originally based on the Velfac 200 and 400 range of components. This update has now been extended to incorporate typical uPVC and timber profiles along with improved representations enabling the objects to be used in conjunction with the default library of doors and windows in ArchiCAD.

To understand how the object can be configured in more detail please review the Modular Joinery Object Documentation.zip. This file contains both the manual and also a movie showing the object being configured.

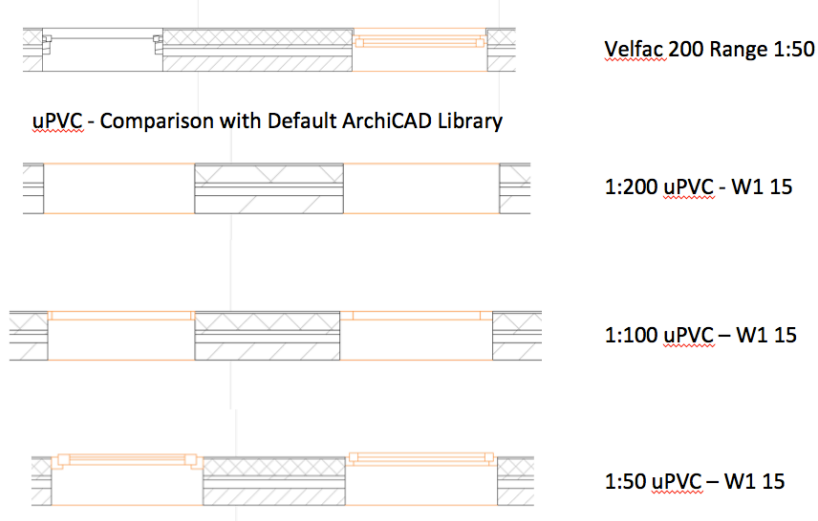

Update improvements include the following

- Opening lines in 2D and 3D
- 2D Contour lines
- UI pages controlled by image menu

- Additional Listing parameters
 - *Matching ArchiCAD's default window / door library parts*

- Improved representations
 - *Better scale sensitivity*

- New profile - Timber & uPVC

There will be another release of this object later in the year to address further customer improvements already scheduled for the object.
